Cell extrusion is a morphogenetic process that is implicated in epithelial homeostasis and elicited by stimuli ranging from apoptosis to oncogenic transformation. To explore whether the morphogenetic transcription factor Snail (SNA1) induces extrusion, we inducibly expressed a stabilized Snail6SA transgene in confluent MCF-7 monolayers. When expressed in small clusters (less than three cells ...

The development of a single cell into a multicellular organism is achieved by a highly regulated process of cell proliferation. Cells divide at the appropriate time and place or remain paused either in the G1/G0 (Cheung and Rando, 2013) or G2 (Bouldin and Kimeiman, 2014) phases of the cell cycle.In this study, we investigate the mechanisms that regulate developmental G2 arrest.
