Exponential Growth and Decay Exponential growth can be amazing! The idea: something always grows in relation to its current value, such as always doubling. Example: If a population of rabbits doubles every month, we would have 2, then 4, then 8, 16, 32, 64, 128, 256, etc!

The exponent for exponential growth is always positive and greater than 1. The exponent for decay is always between 0 and 1. Exponential growth is when numbers increase rapidly in an exponential fashion so for every x-value on a graph there is a larger y-value. Decay is when numbers decrease rapidly in an exponential fashion so for every x-value on a graph there is a smaller y-value. An example of exponential growth is the rapid population growth rate of bacteria.

## **Difference Between Exponential Growth and Exponential Decay**

Exponential Growth and Decay Exponential decay refers to an amount of substance decreasing exponentially. Exponential decay is a type of exponential function where instead of having a variable in the base of the function, it is in the exponent.

The two types of exponential functions are exponential growth and exponential decay. Four variables (percent change, time, the amount at the beginning of the time period, and the amount at the end of the time period) play roles in exponential functions. In the case of a discrete domain of definition with equal intervals, it is also called geometric growth or geometric decay since the function values form a geometric progression. The formula for exponential growth of a variable  $x$  at the growth rate  $r$ , as time  $t$  goes on in discrete intervals (that is, at integer times  $0, 1, 2, 3, \dots$ ), is

## **Exponential growth - Wikipedia**

So, the rule for the function can also be written as  $y$  equals capital  $A$  times little  $a$  to the  $x$ . If little  $a$  is greater than one, then we have exponential growth, and if little  $a$  is less than one then we have exponential decay. In many applications, the input variable  $x$  denotes time. But let's apply the exponential decay to model air pressure.
